

Grammatical Analysis (April 4th)

Choose right audio settings for this player according to your audio system requirement after connection is made. If the type of speaker connected does not satisfy the channels recorded in MPEG 2 disc, the disc will not be played in all channels but only in 2 channels (i.e. even if the front speakers and the centre speakers are connected, a disc recorded in 5.1 channels will be played back only in 2 channels) DVD recorded in Linear PCM/192KHZ sampling will also be played in only 2 channels. When a scart cable is used to output the analog audio signal, it is recommended that the analog audio output be set as 2 channels; otherwise there would not be other channels signal output such as no actors voice when playing 5.1 channels disc.
