

# Lexical Resources -Examples

- DBR-MAT

```
lex_entry_g(40,'Oelphase',term,_,  
crossref([],[35,89]),25,none,  
sem([29],[],none))
```

- VERBMOBIL

Entry 10788 matches

String key verkehrsg"unstiger

Orth: verkehrsg"unstiger

Phon:f6ke:6sgYnstIg6

OrthSeg:ver+kehr#+s#g"unst+ig+er

PhonSeg:f6.+k'e:6#+s#g'"Yns.t+I.g#+6

OrthStem:ver+kehr#+s#g"unst+ig

ver+kehr#+s#g"unst+ig

PhonStem: ...

Flex: A,mixed,sg,nom,mask,pos

A,strong,pl,gen,fem,pos

.....

## Limitations of actual standards

impose saving  
format

- the lexicons were produced with the help of systems that are not any longer maintained: no export facility
- lexicons contain procedural elements dependent on hosting system

no support of joining  
two lexicons

- formats do not match
- differences in linguistic classes
- inconsistency or different granularities for entries

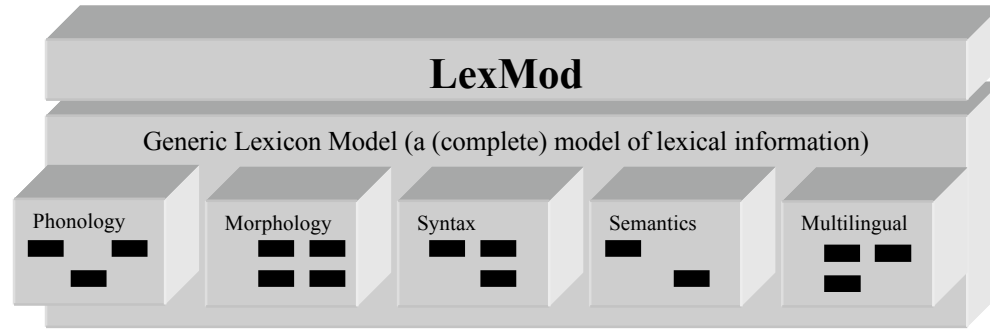

# MANAGELEX

- Generic lexicon management model
- Reads, converts and combines lexicons independent of :
  - format
  - language
  - system requirements
- Architecture levels (following ANSI specifications):
  - meta model level
  - model level
  - real world level

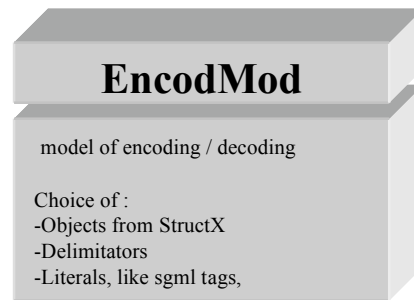

# MANAGELEX-Meta-Model level

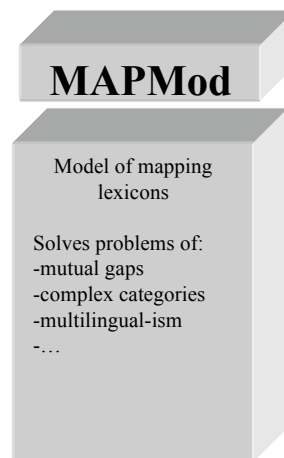

**Module LexMod** is a rich model of possible lexical information

- MULTILEX, MILE

**Module Encod** specifies the data structure for a specific entry and for the lexicon

- OLIF, SALT

**Module Map** specifies the mapping of two lexicons

- takes into account mutual gaps, complex categories, etc.

## MANAGELEX-Model level

EditTool

Writes/ reads/edits entries

StructTool

Defines/changes linguistic structures

CodeTool

- Encodes entries+structures into files
- Decodes Lexicon files

MapTool

Merges two lexicons with possibly different structure

## MANAGELEX- Real world level

Encoded lexicons

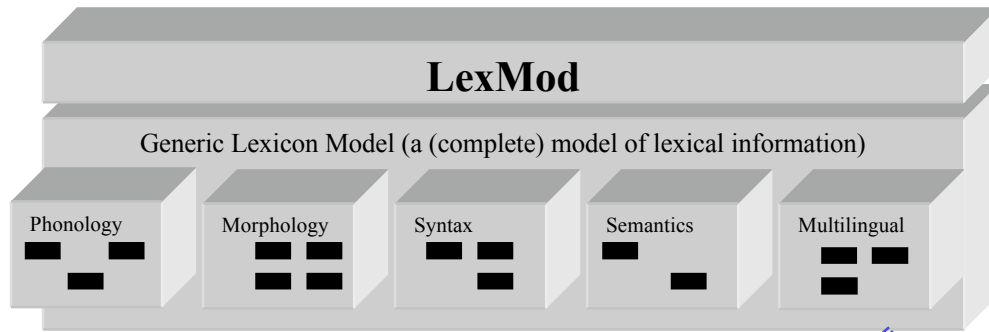

Real, present,  
distinct objects

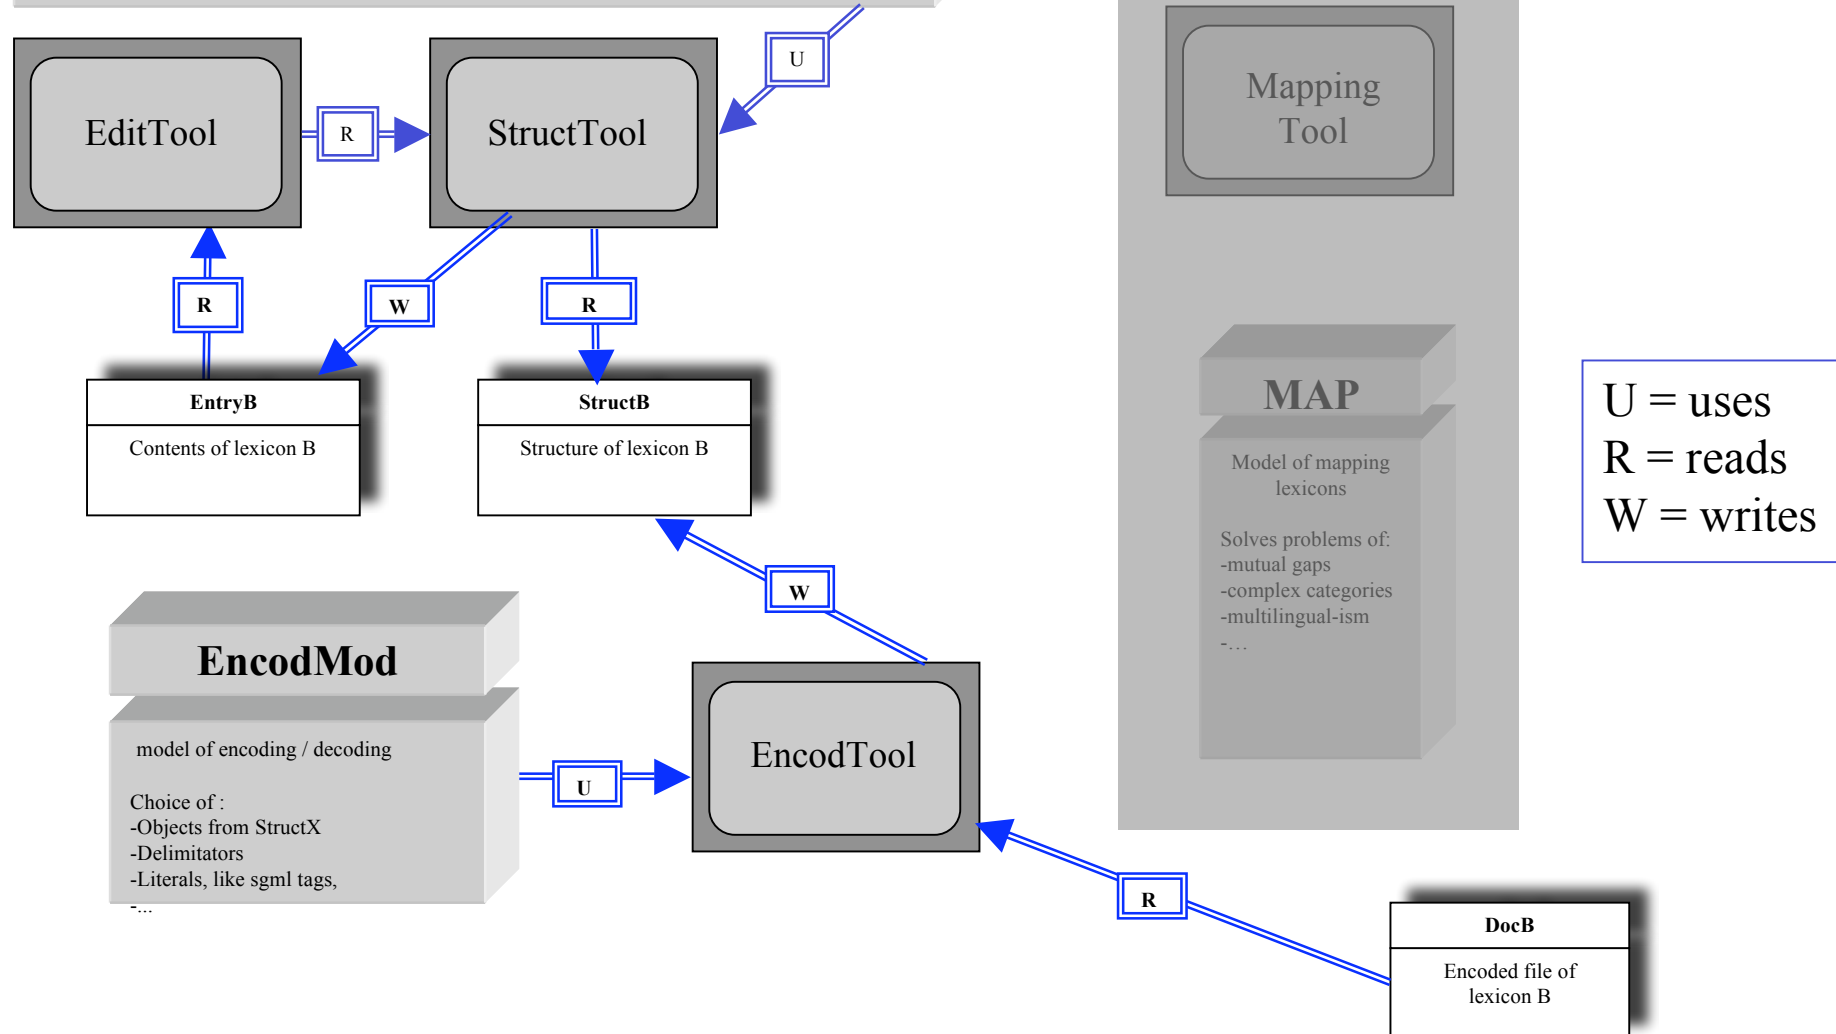

Lexicon structure

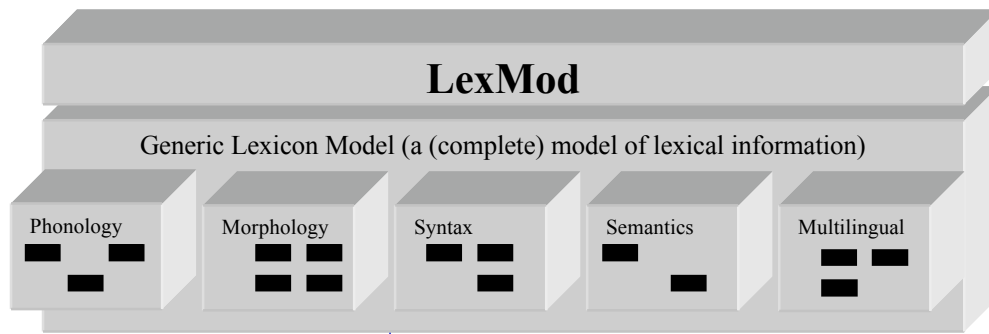

lexical contents

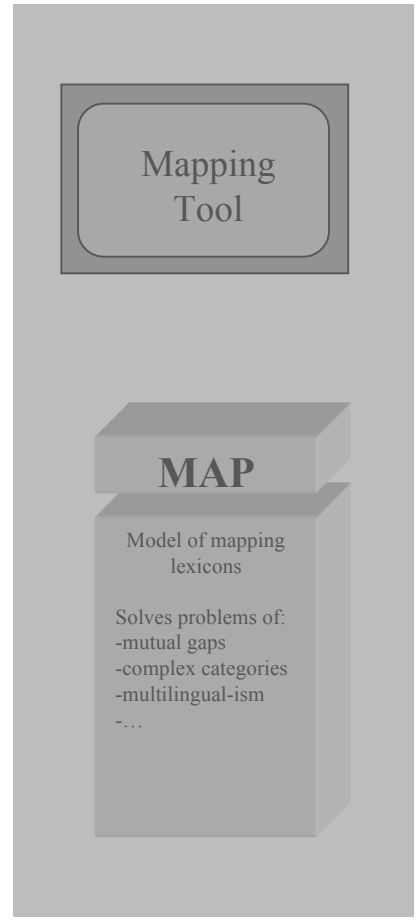

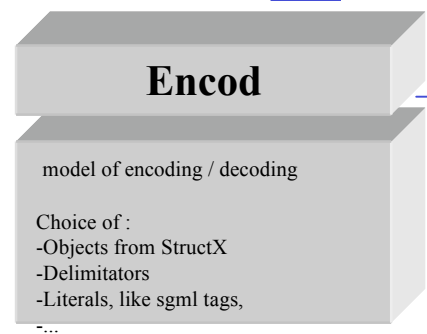

## Function: Reading a lexicon

# Function: Building / updating a lexicon

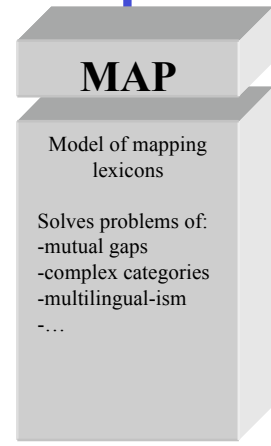

U = uses  
R = reads  
W = writes

## Function: Join two lexicons

U = uses  
R = reads  
W = writes

## State of development

- Prototyping phase
- LexMod, StructTool and EditTools are implemented
- for the moment only European languages are modeled
- no replacement of actual standards but
- supply the use and reuse of already developed non-standard resources
